Ill :Yagmur Yavas  
Doctor :Hakan Yavas  
Treatment :Physiotherapy

<

Hospital class is my main class. The class in which I define the doctor, the ill, and the treatment.

The person class is the class where I get the name and tc number and return the values I get.

Doctor class extra class where I define the doctor's degree and its values are returned.

Ill class extra class where I define the ill's yearofbirth and its values are returned.

The treatment class allows me to combine the doctor and the patient and use it.

The information system class is the class with all its functions.

Not found exception class If the doctor or the patient is not added, it goes to this class and prints the person not found.

Add ill and add doctor function. It helps me to add doctors and patients with the information I get from Main. If I add the same person twice, it prints the already exist command.

Add treatment function. The place where I print the name of the patient and doctor and print the treatment.

Find ill and find doctor function. Where I check the doctor and patient I added.
